Summary

DevOps Engineer with 1+ year of experience supporting production and pre-production AWS environments. Skilled in CI/CD pipeline support, Kubernetes operations, infrastructure troubleshooting, monitoring, DNS/SSL management, and on-call incident response. Strong hands-on exposure to Terraform, Docker, Linux administration, and web server management, with a track record of maintaining application availability and improving operational reliability. Builds internal DevOps tooling to automate infrastructure provisioning end-to-end.

Technical Skills

Cloud: AWS (EC2, S3, Route53, IAM, CloudWatch, ALB/NLB, VPC, RDS (basic), SNS, SQS, KMS, EBS, EFS), GCP (Load Balancer, SSL)

Containers: Docker, Kubernetes (Deployments, Services, Ingress, ConfigMaps, Secrets, Rollbacks)

IaC: Terraform (Modules, Remote State, State Locking, Workspaces)

CI/CD: Jenkins (Build & Deployment Jobs, Pipeline Monitoring, Release Support)

Monitoring: Prometheus, Grafana, SigNoz, CloudWatch Alarms

Linux & Web Servers: Ubuntu, Amazon Linux, CentOS, Apache, Nginx, Tomcat, Reverse Proxy, Virtual Hosts

Networking: DNS, HTTP/HTTPS, SSL/TLS, Load Balancers, CDN, WAF, Security Groups, NACL

Scripting & VCS: Python (Basic), Bash, Git, GitHub

Experience

Junior DevOps Engineer — Cloud2Scale Technologies Pvt Ltd

1+ Year

- Supported production and pre-production AWS environments, participating in on-call rotations to maintain application availability and resolve infrastructure incidents.
- Performed root cause analysis on production incidents, troubleshooting application downtime, service failures, and infrastructure issues across Linux servers, web servers, and Kubernetes workloads.
- Managed AWS infrastructure components including EC2, S3, Route53 DNS records, IAM policies, ALB/NLB, VPC networking, and CloudWatch alarms/dashboards.
- Operated and troubleshot Kubernetes deployments, services, and ingress rules, resolving CrashLoopBackOff, ImagePullBackOff, DNS, and networking issues during production support.
- Resolved a StatefulSet pod stuck in Terminating caused by an EBS Multi-Attach error on a ReadWriteOnce volume following a Karpenter nodeclaim swap.
- Diagnosed and fixed a Kubernetes RBAC gap where a Role's `pods/log` permission existed in YAML but had not been re-applied to the cluster, restoring log access.
- Performed an EKS cluster version upgrade, coordinating workload compatibility checks and rollout to minimize production disruption.
- Updated and renewed SSL certificates on a GCP load balancer, ensuring uninterrupted HTTPS availability.
- Supported CI/CD operations in Jenkins, managing build and deployment jobs, Docker image deployments, pipeline monitoring, and release coordination with development and QA teams.
- Built and maintained Grafana dashboards and Prometheus monitoring to improve infrastructure and application visibility, enabling faster incident detection.
- Administered Apache, Nginx, and Tomcat web servers, including virtual host configuration, reverse proxy troubleshooting, and SSL certificate installation/renewal via Certbot.

- Set up a Jenkins job to automatically start and stop non-production EC2 instances on a schedule, reducing idle infrastructure costs.
- Contributed to infrastructure automation using Terraform (modules, remote state, workspaces), supporting consistent and version-controlled provisioning.

Projects

D-Worker — DevOps Control Plane (Personal Project)

- Building a form-driven platform that automates AWS infrastructure provisioning end-to-end via Terraform, removing the need to hand-write Terraform for common patterns (EC2, VPC, ALB).
- Designed a FastAPI backend with JWT auth, a template registry, and an isolated per-job workspace generator that produces version-controlled tfvars for each deployment.
- Architected a dual-path secrets model using self-hosted HashiCorp Vault: platform-custodied encrypted secrets vs. client-owned secrets backends with connection-config-only storage.
- Designed an IAM bootstrap flow so users provide AWS keys once, after which the platform provisions a scoped IAM role and routes ongoing access through it.

AWS Infrastructure Automation using Terraform

- Automated provisioning of core AWS resources using reusable Terraform modules with remote state management.

Kubernetes Application Deployment

- Deployed and managed containerized applications on Kubernetes, configuring services, ingress, and rollback strategies.

Monitoring Stack using Grafana & Prometheus

- Built dashboards and alerting rules to track infrastructure and application health.

Jenkins CI/CD Deployment Pipeline

- Configured build and deployment jobs for automated Docker image delivery.

Education

B.Sc. Computer Science — Annamalai University (AAGAC)
